

Environmental policy

Kizco A/S

Sustainability is part and parcel of the Kizco's concept. We don't just talk about how we can best take care of the environment, we do something about it.

Our green commitment

We use much less energy for heating and electricity than most other companies, because our offices are at home. Furthermore, our offices have no more than the required number of light fixtures. We use laptops instead of stationary computer that consume less electricity. Since we have home offices, our employee's do not let out any Co2 to the environment by driving to / from work. This save the environment of app. 5, 5 tons Co2 per year and gives us better commitment than our competitors.

However, we feel we can make a difference in other areas as well.

Our green foundation

We regularly implement new projects which build on the solid and sustainable foundation upon which the company rests. Our aim is to constantly improve our routines and procedures, products and services to reduce our environmental footprint, for example:

- * Replacing technical installations
- * Using eco-friendly products
- * Training staff
- * Recycling of waste products acc. To Danish standards
- * Ensuring sustainable sourcing and investments

Our green initiatives by replacing the computers in our offices with new versions that consume 50% less electricity.

We have also modernized several systems and are in the process of replacing all halogen light bulbs with low-energy LED bulbs to further reduce our electricity consumption.

Continuously making green improvements

No matter how many new green projects we carry out, we understand that we will never finish improving our efforts when it comes to sustainability. At Kizco we don't just talk about the environment, we do something about it. Not once in a while, but continuously.
